

MIPRO TOUR GUIDE SYSTEM QUICK GUIDE

IMPORTANT: ENSURE RECEIVERS AND TRANSMITTER ARE CHARGED PRIOR TO USE

Please familiarise yourself with the equipment before your event. This guide is for quick reference only. Should you require more information please refer to the manufacturers handbooks or contact us.

A tour guide system is a wireless radio system used to transmit a message from a presenter to listeners. The presenter simply speaks into a microphone that is plugged into the transmitter. The listeners plug headphones into the receivers to hear the message. This tour guide system can be used indoors and outdoors (with a maximum range of 100m).

After each use, recharge all transmitters and receivers so they are ready for the next event.
